The new villa move-in checklist

12 things to check before your first week

You have the keys. Before the moving truck arrives, a short walk through the house tells you whether your new villa is ready for daily life and flags the issues that are far cheaper to fix now than after you have settled in.

WHY THIS GUIDE MATTERS

Many homeowners only discover water pressure issues, noisy pumps, or hidden system limitations after they have already moved in. By then, fixing them is often more disruptive and more expensive. This guide helps you identify these issues before they become everyday frustrations.

The 12 checks

Work through these in your first week and tick each one as you go. Most take two minutes. Each check tells you why it matters and what good looks like, so you know when to move on and when to take a note.

A Utilities & home systems

01 ☐ Electricity & DEWA

Confirm the account is active and every room has power. Test the main distribution board and the AC isolators — nothing else can be tested until power is stable.

✓ Good: every outlet live, no trips when AC starts

02 ☐ Air conditioning

Run each unit and confirm cooling on every floor. A weak unit found now is a handover fix, not a summer emergency.

✓ Good: steady cooling, no water around indoor units

03 ☐ Water system & booster pump — health check

Find the tank and pump and note the pump's make and model. Then check what actually matters day to day:

- ✓ Does pressure remain stable, without fluctuating?
- ✓ Is pressure consistent upstairs?
- ✓ Can two showers run simultaneously?
- ✓ Is the pump quiet — or does it become noisy?
- ✓ Does water temperature change when another tap opens?

04 ☐ Internet & connectivity

Check the line is provisioned — coverage gaps are easier to fix before the furniture arrives.

✓ Good: strong signal on upper floors and outdoor majlis

B Test water across the home

05 ☐ Master bathroom shower

The shower you will use daily — weak flow here is felt every morning.

✓ Good: strong, steady flow with fast hot water

06 ☐ Guest bathroom

Rarely used lines are where airlocks and weak branches hide.

✓ Good: same strength as the master bathroom

07 ☐ Kitchen tap

The most-used tap in the house also feeds your appliances.

✓ Good: steady flow, no sputtering or air

08 ☐ Outdoor & irrigation tap

Garden lines are the longest run from the pump — weakness shows here first.

✓ Good: usable pressure at the furthest point

09 ☐ Run several outlets at once

Open two showers and the kitchen tap together. A fixed-speed pump cannot hold pressure when demand rises.

✓ Good: no visible drop at any outlet

10 ☐ Listen for pump noise

A loud or constantly cycling pump is working harder than it should — an early warning worth noting.

✓ Good: barely audible, no constant start-stop

11 ☐ Pressure on the highest floor

Upper-floor bathrooms are usually the first place where pressure problems appear.

✓ Good: strong, steady flow

✓ Good: no fluctuation when another tap opens

12 ☐ Hot water reaches every tap

Temperature swings when other taps open point to a pressure imbalance, not the heater.

✓ Good: consistent temperature, even with a second tap open

UP NEXT

Problems homeowners find too late

Problems homeowners find too late

Four issues come up again and again in handover season. None of them show up in a quick glance, so test for them on purpose. For each one: why it happens, what it feels like, and what to do.

Weak pressure upstairs

WHY IT HAPPENS

The pump cannot lift enough pressure to the top of the house.

WHAT YOU'LL NOTICE

Upper-floor showers trickle while the ground floor feels fine.

RECOMMENDED ACTION

Have your pressure system assessed before moving in.

Drops when taps share

WHY IT HAPPENS

Traditional fixed-speed pumps cannot adapt when demand increases.

WHAT YOU'LL NOTICE

Your shower becomes weaker when someone opens another tap.

RECOMMENDED ACTION

Test several outlets together and ask which pump is installed.

Pump noise

WHY IT HAPPENS

A pump that is loud, hums through walls, or cycles constantly is working harder than it should.

WHAT YOU'LL NOTICE

A hum in living areas whenever water runs, and start-stop cycling at night.

RECOMMENDED ACTION

Note the pump's model and behaviour, and book an inspection before it fails.

High energy use

WHY IT HAPPENS

An older fixed-speed pump runs flat out whenever any tap opens, drawing full power for a half-open faucet.

WHAT YOU'LL NOTICE

Electricity bills that climb with every extra minute of water use.

RECOMMENDED ACTION

Ask whether the installed pump is variable speed before you rely on it.

WHAT TO ASK YOUR FACILITY MANAGER OR CONTRACTOR

Which booster pump is installed, and what is its make and model?

Can it hold steady pressure when several outlets run at once?

Is it energy efficient, or does it run at full power every time?

How quiet is it during normal daily use?

5 mistakes new villa owners make

These come up in almost every handover. Avoiding them costs nothing this week — and saves real disruption later.

1

Assuming pressure is fine because one tap works

A single open tap tells you almost nothing. Pressure problems only appear when the house is used the way a family actually uses it.

2

Never testing multiple outlets

Two showers and the kitchen tap together is the real test. If pressure drops when demand rises, you have found the weak point of the system.

3

Ignoring pump noise

A loud or constantly cycling pump is not a quirk — it is a pump working harder than it should, and an early warning of wear and failure.

4

Choosing bathroom fixtures before checking water performance

Rain showers and multi-jet fittings demand steady pressure. Confirm the system can deliver it before you invest in the fixtures.

5

Waiting until after move-in to identify pressure issues

Once you have settled in, every fix is more disruptive and more expensive. The cheapest week to solve a water problem is the week before you move.

Stable pressure, from day one

If your checks turned up weak pressure, drops when taps share, or a noisy pump, the fix is the system behind the taps. Start with the outcome you actually want to live with:

WHAT BETTER WATER PRESSURE FEELS LIKE

- ✓ Strong showers on every floor
- ✓ Stable pressure with multiple taps
- ✓ Quiet operation
- ✓ Lower energy consumption

GRUNDFOS SCALA2

SCALA2 delivers these benefits through intelligent pressure control.

Constant pressure

It senses demand and adjusts speed in real time, so a second or third tap opening does not weaken the first.

Lower energy use

Variable speed means it uses only the power the moment needs, rather than running flat out every time.

Quiet operation

Typical running noise around 44 dB(A), about the level of a calm conversation, in one compact unit.

One built-in unit

Pump, motor, sensor, drive and protection in a single self-priming booster for up to three floors and eight taps.

45 m

MAXIMUM HEAD

44 dB(A)

TYPICAL NOISE

8 taps

UP TO 3 FLOORS

Found a pressure problem?

Book a quick inspection and we will tell you what your home needs — so your first week ends with strong showers, quiet nights and water that just works.
